PROFESSIONAL SUMMARY

Senior LLM / GenAI Engineer and Tech Lead with 5+ years of experience across enterprise payments, NFR/performance engineering, and agentic AI product delivery. Led a team of 5 engineers delivering 6 production LLM systems using GPT-4, Claude, LangChain, LangGraph, and Neo4j on complex brownfield codebases. Proven track record combining hands-on LLM system design (structured outputs, tool use, RAG, agentic workflows) with strong engineering fundamentals — including reducing single-transaction latency from 18s to 2s. Deep expertise in LLD/HLD, impact analysis, and partnering with product owners to ship reliable, evaluation-aware GenAI systems.

TECHNICAL SKILLS

LLM & AI	GPT-4, Claude (Anthropic), OpenAI API, LangChain, LangGraph, LangSmith, Prompt Engineering, Structured Outputs, Tool Use / Function Calling, RAG, Agentic Workflows, Multi-Agent Systems
Data & Vector	Neo4j, Knowledge Graphs, Graph RAG, FAISS, Pinecone, ChromaDB, PostgreSQL, Redis
Backend	Python, FastAPI, Node.js, RabbitMQ, REST APIs, Microservices, IBM MQ, SWIFT Payments
DevOps & Cloud	AWS, Docker, Kubernetes, CI/CD, Git
Observability	Dynatrace, AWR, Performance Tuning, Log Analysis
Frameworks	TensorFlow, LangChain Agents, LangGraph Workflows

WORK EXPERIENCE

Team Lead – LLM / GenAI & Agentic Systems | **Pratishthan Software Ventures** *April 2025 – Present*
Bangalore, India

- ▶ Lead a team of 5 engineers building an infra-level code generation platform that converts LLD + configuration into consistent backend/infra code in one click, aligned with existing architecture patterns.
- ▶ Built a single-click agent creation platform using Python, LangChain, GPT-4, and Anthropic Claude, enabling non-experts to create zero-code LangChain agents by editing only prompts and configurations.
- ▶ Designed a component test (CT) generation system using LLD + chat-based interaction to generate design- and code-aware tests isolated from production release, keeping tests stable during active development.
- ▶ Architected a Neo4j-backed knowledge graph that parses codebases to model components, relationships, and business flows — supporting impact analysis and brownfield reuse across services.
- ▶ Led development of an LLM-powered designer assistant for product owners: conversational LLD authoring with one-question-at-a-time guidance, highlighting impacted services and APIs via the knowledge graph.
- ▶ Built a log analyzer using GPT-4 structured outputs to parse, summarize, and compare log streams — surfacing anomalies, recurring patterns, and likely causes to reduce SLA breach risk.
- ▶ Responsible for task planning, LLD/HLD architecture reviews, and code reviews for the GenAI team, working closely with product and architecture stakeholders.

Senior Software Engineer – Payments & NFR | **Pratishthan Software Ventures** *April 2023 – March 2025*
Bangalore, India

- ▶ Drove a key NFR initiative that reduced single-transaction latency from 18 seconds to 2 seconds by analyzing production logs and resolving non-functional issues across multiple payment platforms.
- ▶ Tuned database, caching, and messaging layers based on Dynatrace and AWR insights to systematically eliminate performance hotspots and stabilize end-to-end transaction times.
- ▶ Enabled connection pooling in IBM MQ and configured Redis authentication/authorization, improving throughput and reliability for SWIFT and UK Faster Payment services.
- ▶ Designed SWIFT microservice architecture and integrated existing modules; built Payment Card Plugin for international transactions on banking digital platforms.
- ▶ Built internal GenAI tools using OpenAI/GPT-4 for log analysis and pattern recognition to speed up inconsistent issue detection and improve SLA adherence.
- ▶ Created and reviewed technical documents assessing the impact of new features on existing services; handled production defects and deployment issue resolution.

Software Engineer – Payments & Microservices | Pratishtan Software Ventures

January 2021 –

March 2023

Bangalore, India

- ▶ Designed and developed UK Faster Payment System (UKFPS) microservices and REST APIs for UK banks, delivering NFR and operational requirements end-to-end.
- ▶ Led design, development, production rollout, and live bug fixing for Hong Kong Faster Payments System (HKFPS).
- ▶ Implemented services using Node.js, RabbitMQ for data streaming, and Redis + PostgreSQL for data storage.
- ▶ Developed a standing instruction payment service for mandates and integrated it into existing payment modules.
- ▶ Contributed to SWIFT-related services and enhancements within large-scale payment platforms.

EDUCATION

Bachelor of Engineering – Information Technology

April 2020

Singhad Institute of Technology, Pune
